

B01 GATE A REVIEW - RETAIL ORDERS

Protected post-attempt review |

Unlock rule

Open only after the Gate A attempt and evidence are saved. Review/tutorial/AI solving during the protected attempt contaminates that attempt.

Objective control packet

Control	Expected
orders_rows	24
items_rows	48
promo_rows	17
promo_distinct_orders	12
event_rows	39
orphan_event_rows	1
completed_orders	14
completed_revenue	78432.5
all_order_revenue	141840.0
duplicate_promo_business_rows	1

Competency rubric - 0 to 4

- Grain/cardinality contracts: no unexplained fan-out or multiplied measures.
- Staged SQL: named/inspectable transformations with defensible grain.
- Window/time rules: deterministic order/ties/frames/boundaries.
- Quality/debugging: violated rule exposed; first failing contract identified.
- Reconciliation: independent row/key/financial controls.
- Execution awareness: EXPLAIN/index reasoning is cautious and evidence-based.
- Maintainable handoff: another person can rerun, validate, modify and recover.

Pass and routing

PASS requires every critical competency $\geq 3/4$, objective controls consistent, and no unresolved grain/cardinality/validation failure. Narrow weakness -> targeted repair + changed micro-retest. Broad or contaminated attempt -> explicit fresh full Gate routing. Passing Gate A ends B01. Gate B/C never open automatically.

Automatic critical failures

- Naive one-to-many/many-to-many join changes a business total and is presented as correct.
- DISTINCT hides unexplained fan-out.
- Validation repeats the same flawed logic and cannot catch the original error.
- Protected attempt used review/tutorial/AI solving.
- Performance improvement is claimed without measurement/evidence.
