

B02 - Python Pipeline Transition

Fast Track | 10 lessons |

Why this module exists

Course 1 taught analyst Python. B02 changes the standard from "my notebook gives an answer" to "a clean-start, validated, rerunnable small pipeline can be handed to someone else."

Exact route

- Open B02 learner book at the exact current lesson.
- Follow the teacher example once.
- Open B02 practice notebook and attempt only the matching P-B02-Lxx task.
- Save code/output/error/validation before opening the protected review.
- Open matching Review B02-Lxx; repair the named weak skill.
- Close review; complete changed retry.
- After L01-L10 mastery, complete Mini-Lab.
- Attempt Gate A independently. B/C remain physically protected unless explicitly assigned.

Current runtime boundary

Truthful QA

Current source references target Python 3.14.7 / pandas 3.0.5 / Requests 2.34.2. Package fixture checks were executed in the build environment under Python 3.13.5 / pandas 2.2.3 / Requests 2.32.5. Real learner environment execution remains a release check.

C3 boundary

Do not pre-install or master Linux/WSL2, Git workflows, venv/dependency pinning, CLI design or Docker here. C3-00 teaches those from zero. Do not turn B02 API basics into auth/pagination/retry mastery; C3-01 owns that depth.
