

B03 Targeted Remediation Cards

Repair the failed competency — do not restart the module.

R1 Grain contract

Given three small tables, write the business process and one-row grain. Block any mixed-grain fact.

Fresh evidence required: save the new result, validation, one failure/recovery note and 60–90 sec explain-back. A repair never auto-unlocks a protected B/C Gate.

R2 Key/cardinality/bridge

Given dirty dimension key + membership table, distinguish duplicate-key defect from legitimate bridge and write relationship contracts.

Fresh evidence required: save the new result, validation, one failure/recovery note and 60–90 sec explain-back. A repair never auto-unlocks a protected B/C Gate.

R3 Multiple facts/date roles

Given two transaction facts + one target fact, identify conformed dimensions and explicit date roles without direct fact join.

Fresh evidence required: save the new result, validation, one failure/recovery note and 60–90 sec explain-back. A repair never auto-unlocks a protected B/C Gate.

R4 Reconciliation/handoff

Given raw controls + model totals with one mismatch, isolate the first failed invariant and write the corrected handoff note.

Fresh evidence required: save the new result, validation, one failure/recovery note and 60–90 sec explain-back. A repair never auto-unlocks a protected B/C Gate.
