

B03 Gate A Protected Review — Fleet Maintenance

Open only after the matching genuine Gate attempt is saved.

Routing

Gate A is the normal independent first attempt. A weak result routes to targeted repair; it does NOT automatically expose Gate B.

Objective raw controls

- vehicles 20
- technicians 8
- work orders 48
- part lines 96
- labor logs 72
- vehicle certifications 25
- base service cost 121,350
- parts cost 64,125
- labor cost 90,405
- closed work orders 32

Competency check

- Business process + fact grains are explicit and consistent.
- Dimension keys/cardinalities and any bridge membership are defensible.
- Different-grain facts/date roles are handled without silent fan-out.
- Raw-to-model reconciliation passes and unresolved quality issues are visible.
- Engineering handoff + rejected alternative + short defense are present.

Critical failures

Mixed grain, unresolved fan-out, arbitrary many-to-many/DISTINCT repair, failed reconciliation hidden, or model cannot be explained/reproduced.

After review

Close the review. Complete only the targeted repair assigned. A targeted repair is not itself a fresh full Gate retest.
