

B03 Gate C Protected Review — Energy Meter Readings

Open only after the matching genuine Gate attempt is saved.

Routing

Gate C exists only after explicit second full-retest assignment. Pass requires the competency floor and no unresolved critical failure; passing C closes the module Gate route.

Objective raw controls

- sites 12
- meters 24
- readings 432
- alarms 60
- meter-program memberships 28
- target rows 8
- reading kWh total 27,086.4

Competency check

- Business process + fact grains are explicit and consistent.
- Dimension keys/cardinalities and any bridge membership are defensible.
- Different-grain facts/date roles are handled without silent fan-out.
- Raw-to-model reconciliation passes and unresolved quality issues are visible.
- Engineering handoff + rejected alternative + short defense are present.

Critical failures

Mixed grain, unresolved fan-out, arbitrary many-to-many/DISTINCT repair, failed reconciliation hidden, or model cannot be explained/reproduced.

After review

Close the review. Complete only the targeted repair assigned. A targeted repair is not itself a fresh full Gate retest.
