

B04 Gate B - Protected Review

Domain: Inventory Replenishment

Unlock: only after a genuine Gate B attempt is saved.

What the Gate is testing

Workload/source boundary; storage/warehouse reasoning; business/surrogate/history strategy; ETL/ELT boundary; layered system; batch/streaming trade-off; lineage/metadata/ownership; quality block/warn/reconciliation; replay/backfill recovery and professional handoff.

Critical failures

Hidden data loss; unresolved duplicate/ambiguous history; totals accepted without key checks; orphan/error rows silently deleted; source truth overwritten; unsafe state advancement; unbounded replay; no independent reconciliation; architecture cannot be defended from the supplied evidence.

Review method

Compare your saved response against the source contracts and control evidence. Identify the smallest weak competency. Do not replace the whole attempt with this review. Record failure code, evidence and repair action.

Freshness protection

Gate B uses its own domain/data. A previous Gate answer must not be reusable by memorization. Protected review stays separate from the response workbook and fixture ZIP.

Next route

PASS after an explicitly assigned full reassessment -> B05. If instability remains, targeted second repair. Gate C remains sealed unless an explicit second full-retest assignment is issued.

History rule

Keep the original attempt append-only. A later pass does not erase the earlier failure/repair evidence.
