

B04 CareFlow Mini-Lab - Protected Review

Unlock condition: You saved your independent CareFlow architecture, quality/recovery plan, reconciliation and explanation. If not, close this file.

Strong architecture evidence

Source contracts are read before design. Operational appointment/payment sources are protected. Durable raw evidence is preserved. Serving outputs have declared grain/consumer. Provider history distinguishes business identity from historical versions.

Quality evidence

The duplicate provider effective pair, bad provider FK, orphan event and orphan payment are surfaced. The response chooses block/warn/quarantine deliberately instead of deleting them to make totals look clean.

Recovery evidence

The runbook identifies affected scope, preserved inputs, state/checkpoint behavior, duplicate prevention, isolated reprocessing and post-recovery controls before promotion.

Reconciliation evidence

Observed controls are independently recomputed from the supplied source files. A control total matching is necessary but not sufficient if key/history checks still fail.

Changed retry

Close this review. New case: a late provider-history correction arrives after last week's utilization mart was published. Write the smallest safe bounded recovery and two controls that prove historical and current outputs are both correct.

Pass rule

PASS requires correct architecture + explicit defect handling + bounded recovery + independent reconciliation + own-words defense. Then Gate A becomes the next route.
