

B05 Gate B Protected Review - Digital Advertising

Open only after the matching genuine Gate attempt is saved.

Gate role

fresh full retest after explicit assignment

Routing

Gate B exists only after explicit assignment. A weak B -> targeted repair; Gate C remains sealed until explicitly assigned.

Competency floors

- Architecture starts from workload/location/sensitivity/freshness/failure requirements.
- Storage and compute are separated; Fabric item/service choices have rationale and a rejected alternative.
- Private/on-prem connection needs are correctly distinguished from cloud sources.
- Least privilege separates workspace/item/data access and human/group/service identities.
- Freshness is measurable and monitoring includes signal, owner, recovery, post-recovery validation and downstream communication.
- Analyst-to-DE handoff is reproducible, testable and names limitations/impact.

Critical failures - block pass

Ungrounded service selection; private source has no secure connection boundary; broad unsafe permissions; freshness SLA ignored; failure has no owner/recovery/post-validation; hidden paid-tenant dependency; or handoff cannot be objectively accepted/rejected.

After review

Close this review. Targeted repair does not itself count as a fresh full Gate. Failed attempts remain in append-only evidence history.
