

HomeFix Mini-Lab Protected Review

Open only after the entire HomeFix independent attempt is saved.

What strong evidence proves

The architecture begins from HomeFix source/freshness/sensitivity constraints; Dispatch_SQL gets a private connection boundary; large Service_Photos gets an explicit copy/reference rationale; human/group/service identities are separated; every freshness promise has monitoring/owner/recovery/validation; the handoff has objective acceptance evidence.

Incident checks

- Router change breaks Dispatch bridge: diagnose network/private-connection boundary, not Fabric generically.
- Technician API 429 with incomplete pages: do not accept partial data because the job returned some rows.
- CRM adds emergency_contact_number: sensitivity/access review is required before silently exposing the new field.
- Parts SFTP nine hours late: freshness breach requires owner + consumer communication even if yesterday's output still opens.

Changed retry

Fresh changed condition

Assume Dispatch_SQL moves to a managed cloud database, while an external contractor now needs read-only access to a small curated subset. Close this review. Re-evaluate only network/access/storage decisions that should change and preserve the ones that should not.

Pass evidence

Saved first attempt + corrected changed retry + architecture/access/freshness/handoff evidence + 60-90 second defense. A polished diagram alone is insufficient.
