

B06 Targeted Remediation Cards

Use only the assigned card. Repair the earliest broken contract; do not restart B01-B06.

Card 1 - SQL / model integrity

Fresh rental-reservations case: reservation + items + status events + customer membership. Build reservation-level revenue, monthly LAG, ranking, quality checks and star/bridge design. Prove raw grains/one-side uniqueness, demonstrate one fan-out failure, keep event/membership grains separate, save maintainable CTE SQL + independent reconciliation. PASS when changed SQL + model evidence both meet ≥ 3 .

Card 2 - Python / quality / recovery

Fresh claims case: three monthly files + customer master + JSON events. One file has malformed numeric data and master has duplicate key. Discover files, add lineage, block/quarantine malformed rows, reject duplicate one-side key, save validation/log/manifest, prove safe rerun and failure recovery. PASS when Python + quality ≥ 3 and critical failure cannot produce trusted output.

Card 3 - Warehouse / cloud / ownership

Fresh case: private ERP orders + cloud API events + finance cloud files; customer region changes historically. Design business/surrogate keys + Type 2 history, landing/validated/curated/serving layers + replay, source connection path, least privilege, schedules/monitoring, handoff + incident recovery + limitation/next action. PASS when Warehousing ≥ 3 , Cloud/Fabric ≥ 2 , Ownership ≥ 2 .

Card 4 - Independent analysis / final defense

Fresh ambiguous case with incomplete stakeholder wording. Write assumptions and acceptance checks before implementation, choose a defensible grain, identify one uncertainty requiring escalation, then defend your approach without reopening the previous Gate review. PASS when Independent analysis ≥ 3 and no protected-answer copying is used.
