

B06 Capstone Practice Review - Protected

OPEN ONLY AFTER the complete Home Services capstone attempt is saved. Close this review before changed transfer.

The capstone has many valid implementations. Compare your evidence against the controls below rather than copying one exact solution.

Review 1 - SQL and reconciliation

Strong: explicit source/result grains, order-level economics built safely from item grain, staged CTE/window/time logic, quality defects exposed, and an independent reconciliation. Critical weak patterns: fee/count multiplied by child rows; DISTINCT used as a bandage; nondeterministic window order; "validation" repeats the same query. Changed transfer: rebuild technician-month output while preserving one independent order-value control.

Review 2 - Python automation

Strong: deterministic file discovery, source lineage, schema/type/key validation before merge, critical defect blocking/quarantine, publish only after controls, saved validation/log/manifest and safe unchanged rerun. Critical weak patterns: hard-coded hidden state, BAD_AMOUNT silently coerced, duplicate technician key allowed, BLOCK failure logged but trusted publish continues. Changed transfer: move input folder and add a fourth monthly file; change configuration/path, not core logic.

Review 3 - Modeling, history and warehouse

Strong: order/item/event/target/membership grains stay explicit; fact/dimension/bridge and cardinality are justified; current vs historical technician attributes are deliberate; SCD business/surrogate key reasoning is documented; layers have source-of-truth and replay contracts. Changed transfer: specialty Type 1, region Type 2; explain different attribute treatment and historical fact lookup.

Review 4 - Platform, monitoring and ownership

Strong: source location/sensitivity/SLA drive connection, identity, access and refresh decisions; private source path differs from cloud/SaaS; monitoring separates auth/network/schema/data failures; recovery has owner + post-recovery validation. Changed transfer: move Orders_DB from private/on-prem to cloud SaaS and tighten event SLA to five minutes; update only affected design.

Review 5 - C3 entry readiness

Do not average away a weak critical area. Required floors: SQL/Python/modeling/warehousing/data quality/independent analysis ≥ 3 ; Cloud/Fabric and professional ownership ≥ 2 ; Final Gate PASS. Repair only the exact failed competency. This review does not authorize Gate B/C; full reassessment must be explicitly assigned.
