

B01 Mastery Check — Protected Review

Open only after a saved genuine closed-book attempt

What strong evidence looks like

The goal is not one exact query. Strong work declares grain before SQL, predicts fan-out, validates stages independently, makes window/time rules explicit, records defects instead of hiding them, and uses controls capable of catching the original failure.

Grain/measure

If a parent measure changes after joining child rows, aggregate children first or compute the parent measure at parent grain. DISTINCT is not a proof of correctness.

Stages

When the final output is wrong, locate the first stage where row/key/financial invariants change. Do not rewrite every stage at once.

Window/time

Tie behavior and frame/boundary behavior must be intentional. Test exact boundaries and a tie case.

Quality

A duplicate rule needs a declared business key. An orphan can be a BLOCK or expected lateness; severity comes from the trust contract.

Validation

A control that repeats the same join/logic can repeat the same bug. Design the control from the failure mode.

EXPLAIN/handoff

Plan shape is evidence; “faster” requires measurement. Another engineer should be able to rerun and validate without your memory.

Changed fresh retry

Close this review. On a different subset/date window in the B01 practice data, build a three-stage transformation that ends at one row per customer-month. Include a child-derived revenue measure and one parent-level measure. Add a deterministic within-region ranking, one half-open event-window count, an orphan/duplicate diagnostic, and an independent money/row reconciliation. Save the retry separately from the first attempt.

Mastery evidence

Mark the non-gating check complete only when the changed retry is correct, independently validated and explainable with this review closed. Gate A remains a separate fresh assessment.
