

B01 Engineering SQL Transition

Astra active route · strong RC1 teaching preserved · assessment layer deepened

Open in this order

1) Existing learner book → 2) mapped SQL practice → 3) Quick Revision → 4) closed-book Module Mastery Check → 5) protected check review after a genuine attempt → 6) changed retry → 7) Gate A.

Why the learner book is preserved

The current 8-lesson book already uses the required beginner-first bridge loop: why/picture/new words/source/guided work/fresh task/validation/teach-back/protected review/changed retry/evidence. Rewriting it only to change a version label would risk losing useful explanations and source mappings.

Gate rule

A clean Gate A pass ends B01. Gate B/C are fresh remediation-only reassessments. They stay sealed until a saved failed/developing Gate attempt, matching protected review, targeted repair evidence, changed micro-proof and explicit assignment.

Runtime boundary

PostgreSQL execution and EXPLAIN plan behavior must be verified on the learner machine. Static QA can validate SQL fixtures, protected controls, source identity, PDF layout and package integrity; it cannot manufacture a live PostgreSQL plan.
