

B01 Gate A Protected Review — Retail Orders

Protected post-attempt diagnostic review · Astra RC4

Unlock rule

Open only after the saved genuine Gate A attempt and evidence. During the protected attempt, the teaching book, this review, tutorials and AI solving are closed. If the attempt was contaminated, preserve it and use a fresh assigned assessment path.

Objective controls

Control	Expected
orders rows	24
item rows	48
promotion rows	17
event rows	39
completed orders	14
completed net item revenue	78,432.50
all net item revenue	141,840.00
orphan events	1
duplicate promo business rows	1

What the controls do — and do not — prove

Matching these values is necessary but not sufficient. The learner must still defend input/output grain, match cardinality, business population, deterministic window/time rules, independent validation and maintainable handoff.

Failure diagnosis

Diagnostic trap

Joining items at item grain doubles all-order shipping fee from 3,300 to 6,600 if shipping_fee is summed after the join.

Diagnostic trap

Among promoted orders, the distinct-order shipping baseline is 1,500; duplicate/multi-row promotions raise the naive joined sum to 2,100.

Diagnostic trap

The orphan event on order_id 999 must remain visible in quality evidence; silently inner-joining it away is not repair.

Competency decision

PASS requires every critical competency at least 3/4 with no unresolved grain/cardinality/validation failure. A narrow weakness routes to targeted repair. Gate B/C never open automatically; they require the failed/developing prior Gate, this protected review, repair evidence, changed micro-proof and explicit reassignment.

Repair proof and changed retry

Close this review before the retry. Rebuild only the weak competency on a changed slice/definition. Save: the original failed evidence, the repair note, the changed micro-proof, independent control output and an explanation of why the repair would catch the prior failure.

Fresh changed task

Changed micro-proof: use a different status/date slice and produce one row per region with child-derived revenue plus an order-level measure. Prove both against separate controls; add one deterministic ranking and one quality exception count.

Next route

A clean Gate A pass ends B01. If Developing, record targeted repair and changed proof before an explicit Gate B assignment.
