

B01 Gate B Protected Review — Support Tickets

Protected post-attempt diagnostic review · Astra RC4

Unlock rule

Open only after the saved genuine Gate B attempt and evidence. During the protected attempt, the teaching book, this review, tutorials and AI solving are closed. If the attempt was contaminated, preserve it and use a fresh assigned assessment path.

Objective controls

Control	Expected
ticket rows	26
event rows	71
tag rows	32
closed tickets	19
avg closed resolution days	3.5789
closed SLA-met rate	68.42%
duplicate business tags	1

What the controls do — and do not — prove

Matching these values is necessary but not sufficient. The learner must still defend input/output grain, match cardinality, business population, deterministic window/time rules, independent validation and maintainable handoff.

Failure diagnosis

Diagnostic trap

Tickets -> events expands 26 tickets to 71 event rows; tickets -> tags expands to 32 rows.

Diagnostic trap

19 closed tickets become 23 rows after joining tags. A team/SLA summary built at tag grain can look plausible while its denominator is wrong.

Diagnostic trap

Duplicate (ticket_id, tag) evidence must be diagnosed; SELECT DISTINCT after the final summary is not a quality control.

Competency decision

PASS requires every critical competency at least 3/4 with no unresolved grain/cardinality/validation failure. A narrow weakness routes to targeted repair. Gate B/C never open automatically; they require the failed/developing prior Gate, this protected review, repair evidence, changed micro-proof and explicit reassignment.

Repair proof and changed retry

Close this review before the retry. Rebuild only the weak competency on a changed slice/definition. Save: the original failed evidence, the repair note, the changed micro-proof, independent control output and an explanation of why the repair would catch the prior failure.

Fresh changed task

Changed micro-proof: use a different priority/date slice. Produce a team summary without tag/event fan-out, validate the closed-ticket denominator independently, and prove one SLA-rate calculation manually.

Next route

A clean assigned Gate pass ends B01. If still Developing, follow the protected remediation state machine; there is no automatic later Gate.
