

B02 Protected Mastery Review

Open only after a genuine saved attempt - diagnose, close, changed retry

Protected review - open only after a saved genuine attempt

Use this to diagnose your attempt. Do not copy it as a finished submission. Close the review before the changed retry.

Objective controls for the supplied practice batch

Control	Expected
Selected monthly files	3
Combined monthly rows	96
Unique order_id	96
Combined net_sales	370375.00
customers.csv rows / unique customer_id	31 / 30
Duplicate master key	C013
Rows after naive merge to dirty master	99
Naive merged net_sales	378235.00
Inflation from duplicate master key	7860.00
api_response metrics rows	4

What the controls mean

- The duplicate C013 is a deliberate master-quality failure. A production-style batch should fail/quarantine before the many-to-one merge unless an approved master repair is supplied.
- The 7860 inflation is evidence of row multiplication, not a number to patch after aggregation.
- The protected values above are audit controls. Your pipeline should derive its own checks from source fields rather than hard-code protected answers.

Changed fresh retry - review closed

- Run the same validation design against failure_cases/sales_bad_numeric.csv. The string oops in unit_price must create an explicit malformed-numeric failure; do not silently drop the row and publish.
- Run it again against failure_cases/sales_missing_column.csv. customer_id is absent, so the schema contract must fail before merge/publish.
- Save both failure records, show that trusted output was withheld, then restore the clean inputs and prove the next clean run is reproducible.

Mastery decision

Ready when you can independently explain file selection, source lineage, schema/numeric validation, master uniqueness, merge cardinality, validation gating, logs/manifest and rerun behavior without the review open.
