

B02 Python Pipeline Transition

Astra active route - strong RC1 teaching preserved - assessment layer deepened

Open in this order

1) Existing 10-lesson learner book -> 2) existing notebook practice -> 3) Quick Revision -> 4) closed-book Practical Mastery Check -> 5) protected check review only after a genuine saved attempt -> 6) changed retry -> 7) Gate A.

Why the learner book is preserved

The current B02 book already uses the required beginner-first engineering loop: why/picture/new words/source/guided work/expected result/why/recovery/independent retry/validation/teach-back/protected review/evidence. Rewriting it only to change a version label would risk losing useful examples and source mappings.

What RC4 deepens

The weak layer was assessment depth. RC4 adds a separate Quick Revision, an action-based non-gating mastery check, a protected changed-retry review, and deeper Gate A/B/C reviews computed from the actual hidden fixtures.

Gate rule

A clean Gate A pass ends B02. Gate B/C are fresh remediation-only reassessments. They stay sealed until the saved failed/developing Gate attempt, matching protected review, targeted repair evidence, changed micro-proof and explicit reassignment required by the existing Mentor state machine.

Runtime boundary

Static QA can verify notebook JSON, Python code-cell syntax, fixture controls, source mappings, PDF layout and package integrity. It does not claim that every learner machine has executed Python/pandas/Requests, filesystem permissions, Excel engines or live HTTP successfully.
