

B03 Engineering Data Modeling

Astra active route - strong teaching preserved - assessment layer deepened

Open in this order

1) Existing 4-lesson learner book -> 2) matching workbook practice -> 3) Quick Revision -> 4) non-gating closed-book Practical Mastery Check -> 5) protected review after a saved genuine attempt -> 6) changed retry -> 7) FreshRoute Mini-Lab -> 8) Gate A.

Why the learner book is preserved

The existing B03 book already teaches the full Astra loop and uses lesson-specific models for grain, key integrity, conformed dimensions and handoff. RC4 does not replace strong teaching merely to change a version label.

What RC4 deepens

The weak layer was the one-page Gate reviews and lack of a separate closed-book mastery surface. RC4 adds Quick Revision, a non-gating mastery check, a protected changed-retry review and deeper Gate A/B/C diagnostic reviews computed from the real hidden data.

Gate rule

A clean Gate A pass ends B03. Gate B/C remain fresh remediation-only reassessments controlled by the existing saved-attempt -> protected review -> repair evidence -> changed micro-proof -> explicit reassignment state machine.

Runtime boundary

Static QA can validate source files, control totals, workbook/package presence, source mappings, PDF layout and archive integrity. It does not claim learner-machine Power BI, Excel or future warehouse/dbt runtime behavior.
