

# B04 Mastery Check Protected Review

Review, close, changed retry, save evidence

## Protected review - saved genuine attempt required

Diagnose the saved attempt; do not replace it. Close this review before the changed retry.

### Objective controls - Urban Mobility

| Control                | Expected      |
|------------------------|---------------|
| Riders                 | 30            |
| Drivers                | 20            |
| Driver profile changes | 28            |
| Rides                  | 120           |
| Completed rides        | 90            |
| Completed fare         | 20754.00      |
| Payments               | 90 / 20754.00 |
| Ride events            | 450           |
| Monthly targets        | 12            |
| Driver-tag rows        | 24            |

### What strong reasoning shows

- Transaction/event/snapshot grains are named before joins.
- Driver current master is separated from effective-dated history.
- Tag membership is modeled without multiplying ride fare.
- Layer promotion requires explicit quality evidence; raw evidence stays immutable.
- Payments and completed ride fares reconcile before publication.
- Targets remain month-city grain and are not duplicated onto individual rides.

## Changed retry - CareFlow-style clinic platform

- Design provider history where a provider can change clinic/specialty over time.
- Handle one bad provider FK appointment, one duplicate provider effective-date pair, one orphan event and one orphan payment without silently deleting evidence.
- State which failures BLOCK curated promotion and which could WARN while preserving evidence.
- Write the bounded replay/backfill sequence after a faulty transformation rule and the controls that prove the rerun did not duplicate output.

### Move on when

Save the changed retry separately. Mastery requires independent recovery plus a defensible quality/reconciliation contract; this check remains non-gating.
