

B05 Mastery Check Protected Review

Review, close, changed retry, save evidence

Protected review - saved genuine attempt required

Use this to diagnose, then close it. The changed retry must be completed without copying this review.

Expected decision pattern

- Begin from source location, sensitivity, workload, freshness and failure tolerance. Product names come later.
- Use a private bridge/gateway only where a source is private/on-prem or otherwise network-isolated; do not invent one for ordinary cloud APIs/object stores.
- Choose OneLake/lakehouse/warehouse/reference/copy from workload and duplication/governance needs.
- Separate workspace/item permissions from actual data access. Use groups and service identities with least privilege.
- Monitoring must identify evidence, owner, recovery/backfill decision, post-recovery validation and consumer freshness communication.

Changed retry - HomeFix field service

- Private ERP SQL + cloud SaaS work orders + object-store photos + certified reporting.
- Design storage/reference/copy and connection boundaries.
- Give technicians, analysts, finance and pipeline identity the minimum necessary access.
- Define 10-minute operational and daily finance freshness contracts.
- Handle private-source outage and credential expiry with recovery + downstream communication.

Move on when

Save the retry separately. Mastery requires defensible choices and evidence; this check stays non-gating.
