

B05 Quick Revision

Storage, compute, connectivity, identity and operations

Closed-book revision map

Lesson	Closed-book contract
B05-L01	Separate storage, compute, network/connectivity and identity before choosing services.
B05-L02	Map Fabric/OneLake item and storage choices to workload; justify copy/reference and rejected alternative.
B05-L03	Separate control-plane roles from data-plane access; design least privilege and private-source connectivity.
B05-L04	Translate freshness into measurable SLA, signal, owner, recovery, post-recovery validation and consumer message.
B05-L05	Produce an analyst-to-engineer handoff with source, grain, freshness, security, acceptance, failure and impact clauses.

Failure-first recall

- A cloud-accessible SaaS/API/object store does not automatically need an on-premises gateway. A private/on-prem source does need an explicit secure connection boundary.
- Workspace role and data access are different planes. Contributor is not a universal answer for analysts or external partners.
- A nonhuman pipeline identity should receive only the source/target permissions it needs; secrets do not belong in learner workbooks.
- Freshness failure is not merely a failed job: it requires evidence, owner, retry/backfill decision, downstream validation and consumer communication.
- Architecture choices must name a rejected alternative and the requirement that makes it worse.
