

B06 Bridge Mastery Check

Closed-book cross-module synthesis - non-gating

Non-gating Bridge Mastery Check

This does not replace the guided capstone, Final Gate or readiness scorecard. Save a genuine closed-book attempt before the protected review.

Fresh synthesis prompt

- Given three monthly service-order files, an item table, event JSON, technician current/history tables, skill memberships, regional targets and mixed platform sources, state every source grain/key before writing SQL or Python.
- Design a deterministic Python ingestion/validation flow that blocks malformed numeric input and duplicate technician keys before trusted publish; include source lineage and safe rerun evidence.
- Write the SQL/model contract that prevents base fee, item value and events from multiplying each other. Include one window/time comparison and one independent control query.
- Design technician history with business key, surrogate/version key and fact lookup rule; explain one Type 1 vs Type 2 attribute choice.
- Define at least eight quality checks with BLOCK/WARN actions, owners and publish consequences.
- Design private-vs-cloud connection/access/freshness/monitoring treatment without requiring a live tenant.
- Write the handoff: scope, architecture, controls, failure recovery, known limitation, owner and next action.

Evidence to save

- Grain/key/source inventory.
- SQL controls + fan-out proof.
- Python run/validation/recovery evidence.
- Model/history contract.
- Quality contract and reconciliations.
- Platform/freshness/monitoring decisions.
- Professional handoff and 60-90 second defense.

Pass standard

Mastery requires a reproducible evidence chain. The check stays non-gating and cannot mark C3 ENTRY READY.
