

B06 Bridge Mastery Protected Review

Review, close, changed retry, preserve evidence history

Protected review - saved genuine attempt required

Diagnose the saved attempt, close this review, then complete the changed retry without copying its wording.

Strong synthesis pattern

- State grains and keys before joins. Aggregate child facts before combining transaction measures.
- Python validates schema/types/keys before merge; critical defects block trusted publish; source lineage and run evidence are saved.
- Current vs historical attributes are deliberate and facts resolve to the correct historical version.
- Targets and other higher-grain facts are compared only at compatible grain.
- Platform design starts from location/sensitivity/freshness/identity and has monitoring/recovery ownership.
- Reconciliation is independent evidence, not the same transformation repeated twice.

Changed retry

- Move the private orders source to a cloud SaaS API and tighten event freshness to five minutes. Change only the affected connectivity/refresh/monitoring design.
- Add a fourth monthly file and a duplicate master key. Prove the pipeline detects the key defect and remains rerunnable after repair.
- Change technician region from Type 2 to Type 1 while specialty remains Type 2. Explain fact lookup impact.
- Save the retry separately; this review never authorizes Gate B/C or C3 entry.
