

B06 Quick Revision

Bridge synthesis and C3 entry floors

C3 entry revision map

Area	Closed-book proof before C3 entry
Advanced SQL	Explicit grain, staging/CTEs, windows/time logic, quality and independent reconciliation.
Python automation	Reusable deterministic flow with validation, logging/manifest, critical-failure block and safe rerun/recovery.
Data modeling	Facts/dimensions/bridges, keys/cardinality, date roles and historical lookup reasoning.
Warehousing	Business/surrogate keys, SCD treatment, layers, replay/backfill and durable raw evidence.
Data quality	BLOCK/WARN rules plus source-to-output row/value reconciliation; no silent defect hiding.
Independent analysis	Defend ambiguous case choices without solution copying.
Cloud/Fabric	Source location, access, connection, refresh/freshness and monitoring awareness.
Professional ownership	Handoff, failure/limitation, owner, acceptance criteria and next action.

Floor rule

SQL/Python/modeling/warehousing/data quality/independent analysis $\geq 3/4$. Cloud/Fabric and professional ownership $\geq 2/4$. Final Gate PASS. No unresolved critical blocker.

Automatic blockers

- Silent/unreconciled loss or duplication.
- Trusted publish after critical failure.
- Wrong historical key/history answer.
- Unsafe rerun that duplicates/destroys trusted state.
- Hard access/network/freshness constraint ignored.
- Failure cannot be detected, recovered and explained.
- Protected attempt contaminated by solution copying.
